

**Resolutions of the NUSSC comments to the  
DS523 – Development and Application of Level 1 Probabilistic Safety Assessment for Nuclear Power Plants**

| Country | Comment No. | Para/Line No.  | Proposed new text   | Reason   | Accepted | Accepted, but modified as follows | Rejected | Reason for modification/rejection  |
|---------|-------------|----------------|---|--|----------|-----------------------------------|----------|--|
| ENISS   | 1           | Whole document | (...) end points states (...)   | 'End states' is the commonly agreed wording in PSA area. 'End points' should be replaced with 'End states'.  | X        |                                   |          |  |
| UK      | 1           | Whole document | Review the use of “mitigating systems” and any remaining uses of “safety systems” to ensure it is as the guide authors intend it to be. | <p>It is noted that the term mitigating systems has been defined and adopted widely through the guide. However, the switch from “safety systems” to “mitigating systems” is not comprehensive or consistent.</p> <p>It is not clear if remaining uses of “safety systems” is deliberate or an oversight.</p> |          | X                                 |          | <p>The mitigating systems were used to indicate the systems credited and modeled in PSA. These are not only safety systems, could be also non-safety systems performing certain functions which could be credited and modeled in PSA. In the meantime, it is true that the word ‘mitigating’ is confusing and is used in other contexts. Therefore, the term ‘systems credited in PSA’ was used with relevant explanation provided in the footnote (see para 5.4).</p> |

|       |   |                |  |   |  |   |  |  |
|-------|---|----------------|--|---|--|---|--|--|
| ENISS | 2 | Whole document |  | <p>The document uses many wordings to describe systems that may be credited in PSA analysis: “mitigating systems”, “safety or non-safety systems”, “ safety systems”, “mitigating systems (including the systems with supporting functions), “support systems”, “frontline systems and support systems”, “mitigating systems including support systems”. Check has to be done to define and retain homogeneous wording throughout the document.</p> |  | <p style="text-align: center;">X</p> <p>The wording was changed to assure consistency throughout the document. But sometimes the specific terms were used to reflect certain context (e.g. safety and non-safety systems). In this cases the definition from IAEA Safety Glossary is applicable. (see also response to the UK comment #1)</p> |  |  |
| ENISS | 3 | Whole document |  | <p>It appears that references to requirements from other IAEA documents have not been changed from previous revision of this document, although some of these other IAEA documents have been revised. Please check that referencing single requirements is still correct.</p>   | <p style="text-align: center;">X</p> <p>The consistency was once again checked</p> |   |  |  |

|                    |                |                |   |  |  |     |   |   |
|--------------------|----------------|----------------|---|--|--|-----|---|---|
| ENISS              | 4              | Whole document |   | As far as internal or external hazards are concerned, singular should be used instead of plural (i.e. internal fires → internal fire, internal floods → internal flooding, etc.) |  |     | X | The document uses both plural and singular forms. Sometimes it requires use of plural form depending on context. If there are specific examples, where it was found to be wrong we are ready to discuss case by case basis. |
| Russian Federation | Whole document | 1              | The IAEA Safety Glossary 2018 edition does not contain definitions of the specified terms that are used in the IAEA document: Core damage, core damage frequency (fuel damage frequency), probabilistic safety goals, accident sequence, success criteria, plant damage state, human reliability analysis (human error), importance analysis, conditional core damage probability, plant damage states, multi-unit PSA, risk metrics, plant operating states, risk informed approach etc. | The IAEA Safety Glossary should be updated to harmonize terminology used in the IAEA document.   |  | N/A |   | The comments is more to the IAEA Safety Glossary than to the SSG-3 (DS523). At this stage the IAEA Safety Glossary is under revision.   |
| Germany            | 4.             | 1.4 Item (3)   | In Level 3 PSA, public health and other societal consequences are estimated, such as the contamination of land or food from the accident sequences that lead to a release of radioactivity to the environment [NN].<br><u>[NN] Procedures for Conducting Probabilistic Safety Assessments of Nuclear Power Plants (Level 3), IAEA Safety Series No. 50-P-12, 1996</u>   | Add reference regarding Level 3 PSA for consistency.   |  | X   |   | 50-P-12 document is considered to be obsolete and therefore is not references here. Currently there is a TECDOC under development aimed to elaborate on Level 3 PSA methodology (in an early stage of                       |

|         |    |              |  |   |   |  |  |  |
|---------|----|--------------|--|---|---|--|--|--|
|         |    |              |  |   |   | development). In addition, there are plans to propose initiation of a Safety Guide on Level 3 PSA. It is planned to update the reference list Depending on the further developments in this area |  |  |
| Germany | 3. | 1.4 Item (2) | In Level 2 PSA, the chronological progression of <u>core and/or fuel</u> damage sequences identified in Level 1 PSA <del>is</del> <u>are</u> evaluated, including a quantitative assessment of phenomena arising from severe damage to reactor fuel. Level 2 PSA identifies ways in which associated releases of radioactive material from fuel can result in releases to the environment. It also estimates the frequency <del>ies,</del> <u>ies,</u> <u>categories and amounts</u> <del>magnitude and as well as</del> other relevant characteristics of the releases of <u>radionuclides</u> <del>active material</del> to the environment. ... | According to the state-of-the-art, the scope needs to cover both, core and fuel damage. Precision is also needed on the releases. In addition, editorial additions are given. | X |  |  |  |
| Germany | 2. | 1.4 Item (1) | In Level 1 PSA, the design and operation of the plant are analysed in order to identify the sequences of events that can lead to core <u>and/or fuel</u> damage and the <u>corresponding core and/or fuel</u> damage frequencies are estimated ( <del>or fuel damage and fuel damage</del>   | According to the state-of-the-art, the scope needs to cover both, core and fuel damage, in addition editorial additions are given.  | X |  |  |  |

|         |    |               |   |   |   |  |  |  |
|---------|----|---------------|---|---|---|--|--|--|
|         |    |               | frequency, when spent fuel pool is also considered —see Sections 10 and 12).1 Level 1 PSA provides insights into the strengths and weaknesses of <u>structures systems and components (SSC)s</u> important to safety and procedures in place or envisaged as preventing core <u>and/or fuel</u> damage.   |   |   |  |  |  |
| Germany | 1. | 1.4<br>Line 2 | ... PSA provides a methodological approach to <u>for</u> identifying accident sequences that can follow from a broad range of initiating events ...   | Editorial (grammar)   | X |  |  |  |
| Germany | 5. | 1.5<br>Line 2 | ... Level 1 PSA provides insights into design weaknesses and into ways of preventing accidents leading to core <u>and/or fuel</u> damage, which might be the precursor of accidents leading to major releases of radioactive material with potential consequences for human health and the environment. Level 2 PSA provides additional insights into the relative importance of accident sequences leading to core <u>and/or fuel</u> damage in terms of the severity of the releases of radioactive material they might cause, and insights into weaknesses in measures for the mitigation and management of severe accidents and ways of improving them [4]. ... | According to the state-of-the-art, the scope needs to cover both, core and fuel damage. | X |  |  |  |

|         |    |       |  |  |   |   |  |  |
|---------|----|-------|--|--|---|---|--|--|
| Germany | 6. | 1.7   | This Safety Guide replaces IAEA Safety Standards Series No. SSG-3, Development and Application of Level 1 Probabilistic Safety Assessment for Nuclear Power Plants <sup>2</sup> , which it supersedes.   | Clarification on duplication   | X |   |  |  |
| Japan   | 1. | 1.11. | This Safety Guide addresses the necessary technical features of a Level 1 PSA and applications for nuclear power plants (both operating and new plants), on the basis of internationally recognized good practices. Level 1 PSAs have now been carried out for most nuclear power plants worldwide. <del>In recent years, a trend has emerged for Level 2 PSAs or limited Level 2 PSAs for nuclear power plants (e.g. Level 2 PSAs in which the large early release frequency is estimated) [4], as well as in some Member States it is extended to limited assessment of the doses (e.g. limited Level 3 PSA). In addition, Level 3 PSAs have been carried out in several States.</del> The scope of a Level 1 PSA addressed in this Safety Guide includes all <del>operating states</del> <u>operational states</u> of the plant (i.e. at power and shutdown) and all potential initiating events and potential hazards, namely: | <p>i) This description is not relevant to the scope of this Guides publication, rather it is information of three type of PSAs, and then suggested to move back to “BACKGROUND.”</p> <p>ii) Use of terminology defined in IAEA SAFETY GLOSSARY. This usage of the term “operational states” is applied through this draft publication.</p> | X | The sentence was deleted. The BACKGROUND already includes discussion on PSA levels. |  |  |

|         |    |                |  |   |   |   |  |  |
|---------|----|----------------|--|---|---|---|--|--|
| Germany | 7. | 1.11<br>Line 8 | ... The scope of a Level 1 PSA addressed in this Safety Guide includes all plant operationalng states (POS) of the plant (i.e. at power and shutdown) and all potential initiating events and potential hazards, namely: (a) internal initiating events caused by random component failures and human error, (b) internal hazards (e.g., internal fires, and floods, explosions, turbine missiles) and (c) external hazards, both natural (e.g. earthquake, external flooding, high winds, external floods) and of human-induced ones (e.g., aircraftplane crash, explosion pressure wave, accidents at nearby industrial facilities). | Clarification, completeness of examples representing good practice                      | X |   |  |  |
| Germany | 8. | 1.12           | <del>This Safety Guide is focused on the reactor core and the fuel in the spent fuel pool; it does not cover other sources of radioactive material on the site, e.g. the interim fuel storage facilities. The reactor core is in the main focus of this Safety Guide; however, the specifics of the spent fuel pool analysis are addressed.</del> <u>focusses on the assessment of nuclear power plant respective spent fuel pools. An assessment of other sources of radioactive material on the site, such as interim dry fuel storage</u>   | The text is misleading and inconsistent and not in line with discussions had with IAEA. | X | The second part of the proposed revision is not really related to the scope. It is still incorporated in the document but down in the text of the document. |  |  |

|             |    |       |  |  |   |  |  |
|-------------|----|-------|--|--|---|--|--|
|             |    |       | <p><u>facilities or nuclear waste treatment facilities is not in the scope of the Safety Guide.</u></p> <p><u>However, the consideration of any adverse effects of such facilities to the reactor(s) and spent fuel pool(s), e.g. in case of external hazards impairing the whole site, in the assessment are addressed.</u></p>   |  |   |  |  |
| Japan       | 2. | 1.12. | <p>This Safety Guide is focused on the reactor core and the fuel in the spent fuel pool; it does not cover other sources of radioactive material on the site, e.g. the interim fuel storage facilities. The reactor core is in the main focus of this Safety Guide; however, the specifics of the spent fuel pool analysis are addressed. <u>The scope of addressed in this Safety Guide is expanded to cover Level 1 multi-unit PSA which aims to quantify multi-unit risk metrics.</u></p> | <p>It should be explicitly stated that the scope of this guide is expanded.</p>  | X |  |  |
| Netherlands | 1  | 1.12  | <p>This Safety Guide is <b>focused on the reactor core and the fuel in the spent fuel pool</b>; it does not cover other sources of radioactive material on the site, e.g. the interim fuel storage facilities. The <b>reactor core is in the main focus of this Safety Guide</b>; however, the specifics of the spent fuel pool analysis are addressed.</p>  | <p>The text is not clear and not consistent about the focus of the SG (see yellow marks).</p> <p>Please consider rephrasing the paragraph, to clarify the text, and avoid inconsistencies.</p> | X |  |  |

|         |     |                 |   |   |   |  |  |  |
|---------|-----|-----------------|---|---|---|--|--|--|
|         |     |                 |   |   |   |  |  |  |
| Finland | 1   | 1.13.           | The consideration of hazards arising from malicious actions is not within the scope of this Safety Guide. However, PSA applications section discuss the use of PSA for assessment of safety-security interface and enhancements of safety and security. | However, PSA is an effective tool for the analysis of the safety security interface and further enhance the safety and security of the nuclear power plant and spent fuel pool. |   |  |  | X<br><br>According to the DPP reviewed and agreed by NUSCC, NSGC and CSS the use of PSA for security purposes is out of the scope of this document. IAEA recently launched another activity aimed to investigate the topic of Use of PSA for security purposes and develop a corresponding Agency publication. |
| Germany | 9.  | 1.14<br>Line 2  | ... <del>plant operational</del> <del>operating</del> states ...  | Clarification for consistency   |   |  |  | X<br>Plant operating state is used throughout the document   |
| Germany | 10. | 1.16<br>Line 13 | ... Section 11 provides recommendations on recommendations on Level 1 multi-unit PSA ...  | Editorial (duplication removed)   | X |  |  |  |
| ENISS   | 5   | 1.16            | Section 11 provides recommendations <del>on</del> <del>recommendations</del> on Level 1 multi-unit PSA aimed to quantify multi-unit risk metrics  | Typographical error .   | X |  |  |  |
| ENISS   | 6   | 2.2             | The scope of the PSA to be undertaken should be correlated with the <del>national</del> probabilistic   | The term " <i>national</i> " is not clear. Consistency with para 2.21 that states:  |   |  |  |  |

|         |     |               |  |  |   |  |  |  |
|---------|-----|---------------|--|--|---|--|--|--|
|         |     |               | safety goals or criteria, if they <del>latter</del> have been set <u>specified in national regulations or guidelines</u> .   | <i>“..the results of the PSA should be compared with the probabilistic safety goals or criteria if these have been specified in national regulations or guidelines</i> |   |  |  |  |
| Germany | 11. | 2.3<br>Line 3 | ... The scope of the Level 1 PSA <del>might</del> <u>should</u> also include consideration of the fuel in the spent fuel pool, ...   | SFP PSA represents state-of-the art, see e.g. OECD/NEA WGRISK reports on Use and Development of PSA  | X |  |  |  |
| ENISS   | 7   | 2.3           | The scope of the Level 1 PSA <del>might</del> <u>should</u> also include consideration of the fuel in spent fuel pool, for which recommendations are provided in Section 10.   | The requirement for a Spent Fuel Pool PSA appears too weak with “ <i>might</i> ”. “Should” is usually used in guides.  | X |  |  |  |
| Japan   | 3.  | 2.5.          | Paragraphs 2.5 and 2.6 provide recommendations on meeting Requirement 18 of GSR Part 4 [3] on the use and validation of computer codes for a PSA and Requirement 21 of GSR Part 4 [3] on the independent verification of PSA. PSA involves a number of analytical methods. These include the analysis of accident sequences and the associated systems, typically through the development of event tree and fault tree logic models, the methods for solution of the logic models, the models of phenomena that could occur, for | It must be human health and environment to be determined on effect from the transport of radionuclides.  | X |  |  |  |

|         |     |              |  |   |   |  |  |  |
|---------|-----|--------------|--|---|---|--|--|--|
|         |     |              | instance, within the containment of a nuclear power plant following core damage, and the models for the transport of radionuclides in the environment to determine their effects on health and the <del>economy</del> <u>environment</u> , depending on the scope of the analysis (Level 1, 2 or 3). Prior to their application, ....t   |   |   |  |  |  |
| Germany | 12. | 2.11/<br>(d) | ...<br>The occurrence frequency of occurrence of specific health effects to members of the public or the frequency of occurrence of particular environmental consequences (Level 3 PSA [NN]).  | Wording + please add reference [NN] regarding Level 3 PSA for consistency, see comment above  | 2 | X<br><br>See response to the comment #4 from Germany |  |  |
| Japan   | 4.  | 2.12.        | <del>The available frameworks and examples for the definition of probabilistic safety criteria are discussed in Ref. [11].</del> In the Member States the probabilistic safety criteria are typically identified as targets, goals, objectives, guidelines or reference values for orientation. In addition, the numerical values for the levels of risk, which correspond to the threshold of tolerability and the design targets, differ from State to State <sup>nn2</sup> .<br><u>(footnote nn2)</u><br><u>The available frameworks and examples for the definition of probabilistic safety criteria are</u> | Ref.[11] is TECDOC publication, which is not a consensus document reviewed by Member States and related SSCs. Therefore, move it to the footnote. | X |  |  |  |

|         |     |                |  |   |   |   |  |   |
|---------|-----|----------------|--|---|---|---|--|---|
|         |     |                | <u>discussed in Ref. [11] IAEA-TECDOC-1804 “Attributes of Full Scope Level 1 Probabilistic Safety Assessment (PSA) for Applications in Nuclear Power Plants”.</u>  |   |   |   |  |   |
| ENISS   | 8   | 2.14           | For example, INSAG (see Ref. [9]) has proposed the objectives for core damage frequency separately for existing plants and future plants.  | Should be Ref.[8] rather of Ref. [9]. See also comment 10 with respect to a more appropriate location for Ref.[9].                              |   |   |  |   |
| Germany | 13. | 2.14<br>Line 4 | For example, INSAG (see Ref. [98]) ...   | Wrong reference   | X |   |  |   |
| ENISS   | 9   | 2.15           | Core or fuel damage frequency <u>for a single unit</u> are the most common measures of risk used in Level 1 PSA.   | Additional precision that is considered important as far as the document addresses both single unit and multi-units perspectives.               |   |   |  | X<br><br>Before that it is specifically noted that the MU considerations are focused in Section 11. For consistency it is proposed not to mention everywhere that we are talking about the single unit. |
| Germany | 14. | 2.17           | PSA can provide useful insights and inputs for various interested parties, such as plant staff (management and engineering, operations and maintenance personnel), regulatory bodies, <u>technical support organisations (TSOs)</u> , designers and vendors, ... | TSOs review PSAs (sometimes with PSA modelling in parallel to the model being reviewed) and contribute to the development of PSA methodologies. | X |   |  |   |
| Japan   | 5.  | 2.17.          | PSA can provide useful insights and inputs for various interested parties, such as <u>plant staff</u>  | Better categorization into operation-related entity and regulator.  |   | X |  |   |

|         |     |      |  |  |   |  |  |  |
|---------|-----|------|--|--|---|--|--|--|
|         |     |      | <u>operating organizations</u> (management and engineering, operations and maintenance personnel), <del>regulatory bodies</del> , designers and vendors <u>and also regulatory bodies</u> .  |  |   | We propose to keep the regulatory bodies in the beginning of the list right after operating organisation as one of the main users of PSA techniques. |  |  |
| ENISS   | 10  | 2.18 | 2.18. Where the results of the PSA are to be used in support of the decision making process, a formal framework for doing so should be established ( <u>see Ref. [9]</u> ).  | Reference to Ref. [9] (i.e. INSAG 25) may be inserted.   | X |  |  |  |
| Germany | 15. | 2.19 | The PSA should address the actual <u>design</u> or, in the case of a plant under construction or when modifications are being undertaken, the intended design or operation of the plant, which should be clearly identified as the basis for the analysis.         | Clarification  | X |  |  |  |
| ENISS   | 11  | 2.21 | This should be done for all probabilistic criteria defined for the plant, including those that address system reliability, core <u>or fuel</u> damage <u>frequency</u> , <u>frequencies of</u> releases of radioactive material, health effects for workers, (...) | English correction   | X |  |  |  |
| Japan   | 6.  | 2.22 | The PSA should set out to identify <del>all</del> accident sequences that contribute to risk and to determine weaknesses and potential improvements in the design or operation of the plant. If the  | Clarification.<br><br>Delete “all”, because it is not feasible to identify all accident sequences that contribute to risk. There |   | X  | The comment is accepted (not all sequences should be identified). Just the |  |

|             |   |             |   |   |   |  |  |  |
|-------------|---|-------------|---|---|---|--|--|--|
|             |   |             | analysis does not address <u>dominant contributors</u> <del>all the contributions</del> to risk (for example, if it omits external hazards or shutdown states), then conclusions drawn from the PSA about the level of risk from the plant, the balance of the safety systems provided and the need for changes to be made to the design or operation to reduce the risk may be biased. | is no consistency with the second sentence of 5.14 also.<br>It is also not feasible to address all contributors to risk including all external event risk.  |   | resolution of the comment is modified in a way to keep the recommendation to identify all sequences, which contribution to the risk is not negligible. We believe that the completeness of the list should be assured for all non-negligible contributors. |  |  |
| Netherlands | 2 | 2.22        | Rephrase the last sentences in 2.22 (“If the analysis... may be biased”)  | This sentence describes that a partial PSA may introduce a bias. This is surely true, and this concept should be retained, but it is not clear what is the “guidance” given here: what should be done in case you have a PSA not addressing “all the contributions to risk”? Should such a “partial” PSA be allowed at all? Please clarify. | X |  |  |  |
| Netherlands | 3 | 2.22 – 2.23 | Please merge these paragraphs.  | Avoid duplications.   |   | X<br>The paras are not merged, but the overlaps between the statements in these paras are eliminated.  |  |  |

|         |     |                                  |  |  |   |   |  |  |
|---------|-----|----------------------------------|--|--|---|---|--|--|
| Germany | 16. | 3.1<br>Line<br>12                | ... and all plant operationalng states ...   | Clarification  | X |   |  |  |
| Germany | 17. | 3.1<br>Line<br>13                | ... In addition, other sources of radiation, particularly (e.g. the fuel in the spent fuel pool,) should be analysed, depending on the formulation of the probabilistic safety goals.  | Precision, strengthening low power and shutdown PSA  | X |   |  |  |
| Japan   | 7.  | 3.2. /<br>Line 9                 | As another example, if it is planned to use the PSA model as a basis for a risk monitor, the PSA model should be ‘symmetrical’ in terms of the modelling of initiating events.   | Clarification.<br>A word, “symmetrical,” should be defined here. The explanation of relationship between “risk monitor” and “symmetrical” is also needed here.   |   | X<br>The connection between symmetrical and risk monitor has been highlighted. The idea of the model being symmetrical is already explained right after the text. |  |  |
| ENISS   | 13  | 3.2                              | An extension of <u>to</u> Level 2 or even Level 3 PSA  | English correction   | X |   |  |  |
| Japan   | 8.  | 3.4./<br>under<br>the<br>bullets | <u>If PSA is performed for the specific plant, in any case, the operating organization should always participate</u> as a source of operational knowledge, as well as being a beneficiary from the insights obtained. <u>If generic PSA is performed as the reference, the participation of operating organization may be preferred to support the knowledge from their operating experiences.</u> | Because the necessity of participation of operating organization is up to the purpose of PSA. If PSA for the specific plant is performed, the operating organization should participate. If generic PSA is performed, the participation of the operating organization is not necessarily required. |   | X<br>This clarification is added in addition to a footnote  |  |  |
| Belgium | 1   | 3.10                             | 3.10. <del>A</del> The members of the team that perform the PSA ...  | Typographical correction   | X |   |  |  |

|         |     |                |  |  |   |  |  |   |
|---------|-----|----------------|--|--|---|--|--|---|
| ENISS   | 12  | 3.10           | A-The members of the team that perform the PSA can be characterized by the organization they represent and the technical expertise they provide. | Typographical error .  | X |  |  |   |
| ENISS   | 14  | 3.14           | General requirements for control of documents are established in section 2 of Ref. [7].  | Reference to Ref. [7] does not appear appropriate (it has not been changed when updating the document). Please check.  | X |  |  |   |
| Germany | 18. | 3.16<br>Line 2 | The documentation of PSA should be complete, well structured, clear and easy to follow, <u>also regarding</u> review and update.                 | Clarification  | X |  |  |   |
| ENISS   | 15  | 4.3            | Currently, in many <u>Member</u> States, performance of a PSA is required as part of the safety analysis report.                                 | Editorial to be consistent with rest of the document.  | X |  |  |   |
| ENISS   | 16  | 5.2            | Fig.1  | 'Human errors probabilities' and 'Reliability and CCF parameters' are numerical data that are needed for quantification step. Associated arrows should be re-directed to 'Quantification and Interpretation of results' instead of 'Accident Sequence analysis'. |   |  |  | X<br><br>X<br><br>We agree that all the relevant inputs are eventually used in quantification. The idea of the figure is to demonstrate what kind of inputs are used from one task to another (in this case to highlight the input is in the event trees and FTs from HRA or CCF analysis) So, we believe |

|---------|-----|---------------|--|---|---|--|---|
|         |     |               | <p>lasting external flooding).<br/> <del>Combined coincidental hazards are normally limited to two.</del></p>  | <p>and therefore not appropriate here. I must be deleted here.<br/> 3. Finally, according to the definition of this combination category, the text maybe unnecessary. This should be discussed.</p> |   |  |   |
| Germany | 52. | 6.14          | <p>The potential combined hazards should be identified starting from the list of individual internal and external hazards applicable to the site. The entire list of applicable hazards should be used for this purpose before any screening analysis is carried out. <del>Usually, combined hazards involve only natural hazards (e.g. a combination of high wind and high sea water level). However, combinations of natural hazards and/or human-induced hazards are also possible and cannot be excluded a priori (e.g. an increased risk of ship accidents during severe weather conditions).</del></p> | <p>The last two sentences need to be deleted, they are not correct and limit the guidance unnecessarily.</p>  | 1 |  | <p>X</p> <p>We propose to keep it because it reflects the current international practice. But to be moved to the footnote for better readability of the ‘should’ statements</p> |
| ENISS   | 60  | 6.16<br>Title | <p>SCREENING OF HAZARDS<br/> <b>AND HAZARDS<br/> COMBINATIONS</b></p>  | <p>The whole section should also be made applicable to hazards combinations.</p>  | X |  |   |
| Belgium | 7   | 6.16          | <p>... The successive screening process should be based on clearly defined screening criteria and consistently applied to ensures that</p>   | <p>Typographical correction (delete “s” in “ensures”)</p>   | X |  |   |

|         |     |          |   |   |   |  |  |  |
|---------|-----|----------|---|---|---|--|--|--|
|         |     |          | none of the significant risk contributors ...   |   |   |  |  |  |
| ENISS   | 61  | 6.16     | The successive screening process should be based on clearly defined screening criteria and consistently applied to ensure that none of the significant risk contributors from any internal, external hazard and hazard combinations relevant to the plant and the site are omitted.   | English correction  | X |  |  |  |
| Finland | 9   | 6.17 (a) | The hazard will not lead to an initiating event. For external hazards, this criterion is generally applied when the hazard cannot occur close enough to the plant to affect it, or when critical components are not impacted (e.g. an <del>internal</del> external flooding scenario that does not generate an initiating event). Satisfaction of this criterion will also depend on the magnitude of the hazard. | 6.19 points out that “None of the criteria listed in para. 6.17 are applicable to <b>internal</b> hazards that originate inside plant buildings.” thus, the given example of an internal flooding scenario must be wrong. | X |  |  |  |
| Germany | 53. | 6.17 (d) | <del>The hazard has a significantly lower mean frequency of occurrence than other hazards with similar character and will not result in consequences that are worse than those from other such hazards. The uncertainty in the frequency estimate for a hazard screened out in this manner and cumulative impact of all screened out hazards are judged as not</del>  | This needs to be deleted – one cannot exclude just by comparing different hazards if they are frequent or not. Moreover, this is not a qualitative argument!  | X |  |  |  |

|         |     |          |  |  |  |   |   |  |
|---------|-----|----------|--|--|--|---|---|--|
|         |     |          | <del>significantly influencing the total risk.</del>   |  |  |   |   |  |
| Germany | 54. | 6.17 (e) | The impact of the combined hazard is not more severe than the effect of the <del>most</del> severe hazard in the combination.  | Suggestion to move this recommendation to combinations issues only. Mixing single and combined hazards up is not helpful.  |  |   |   | X<br>The entire subsection is devoted both to single and combined hazards, therefore it is proposed to keep item (e) |
| Germany | 55. | 6.18     | Quantitative screening criteria applied to hazards should depend on the overall objective of the Level 1 PSA and should correlate with the overall <u>core and/or fuel</u> damage frequency (typically obtained based on full scope PSA). Hazards of very low frequency but with potentially severe consequences in terms of releases of radioactive material should be considered, <u>e.g.</u> for the purposes of a Level 2 PSA. | For hazards it is essential not to limit the frequency to CDF!   |  | X<br><br>(see response to comment #20 from Germany) |   |  |
| Germany | 56. | 6.19     | <del>None of the criteria listed in para. 6.17 are applicable to internal hazards that originate inside plant buildings. These hazards should not be screened out as an entire hazard category and should always be the subject of either bounding or detailed analysis.</del>   | This text is not completely correct and should be deleted. Some of the internal hazards can already be screened out qualitatively if the plant design covers appropriate and reliable (mainly passive) precautionary measures. The authors have not really understood the combined hazards issue |  |   | X |  |

|         |     |       |   |   |  |  |  |  |
|---------|-----|-------|---|---|--|--|--|--|
|         |     |       |   | and should try to understand it from SSG-64 for internal hazards.   |  |  |  |  |
| Germany | 57. | 6.21  | <p>The following external hazards should not be screened out as an entire hazard category:</p> <p>(a) Seismic hazards;<br/> (b) Wind hazards;<br/> (c) External floods;</p> | <p>The text needs to be completely changed. Reasons are:<br/> In areas of low seismicity and appropriate plant design, seismic events can be screened out. Similar argument for flood hazards.<br/> Moreover, these are groups but not categories of hazards, for which the one or the other can be completely screened out. Hazard classes see ASAMPSA_E report or German Hazards Screening Tool HST representing good practice.</p> |  | <p>X</p> <p>According to the Agency Safety Standards the design should consider these hazard groups even with the moderate level (e.g. for seismic see para.2.7 of NS-G-1.6 – currently being revised as DS490). Therefore, the The idea of the paragraph is that the mentioned hazards could not be screened out as not applicable to the site even if the hazard is moderate.</p> <p>The word “hazard class” is used instead of the “hazard category”.</p> |  |  |
| Japan   | 19. | 6.21. | <p>(a) Seismic hazards;<br/> <b>(b) Human-induced hazards;</b><br/> <del>(b)</del>(c) Wind hazards;<br/> <del>(e)</del>(d) External floods;</p>                             | <p>Human-induced hazards should be added, because it is described in 8.1 that human-induced hazards as selected external hazards, which cannot be screened out.</p>   |  | X  |  |  |

|             |     |             |   |   |   |   |                              |  |
|-------------|-----|-------------|---|---|---|---|------------------------------|--|
| Netherlands | 7   | 6.21        | <p>6.21 The following external hazards should not be screened out as an entire hazard category:</p> <p>(a) Seismic hazards;<br/> (b) Wind hazards;<br/> (c) External floods;<br/> (d) <u>Human induced hazards</u></p>  | <p>It is not clear why “human induced hazards” was deleted from this list of hazards that should not be screened out as an entire hazard category (meaning that human induced hazards <u>can</u> be screened out). In the rest of the document they are discussed. See e.g. in 6.8 (Identification of hazards), ch. 8 (Specific aspects of level 1 PSA for external hazards) etc.</p> | X |   |                              |  |
| Netherlands | 8   | 6.22 – 6.24 | Add discussion of “Seismic hazards” and “Human induced hazards”   | Par 6.22 and 6.24 discuss only two of the hazard categories in 6.21.  |   | X | 6.22-6.24 made more general. |  |
| Germany     | 58. | 6.22        | <p>In order to eliminate specific hazards from <del>the high wind category</del> <u>a given hazard class</u>, it should be proven that the <del>climate</del> <u>climatic</u> conditions specific to the location of the plant (<u>topographic, geographic, meteorological, biologic</u>) support the assumption that these hazards are not sufficient to damage the plant (e.g. hurricanes in a non-coastal area, icing in a tropic area, etc.).</p> | <p>A more general requirement is needed, since this is not wind-specific but valid for several hazard classes!</p>  | X |   |                              |  |

|         |     |      |  |  |   |   |  |
|---------|-----|------|--|--|---|---|--|
| ENISS   | 62  | 6.23 | <p><del>Wind hazards</del> <u>External hazards</u> with a certain potential for damage should be screened out only when it is demonstrated that the frequency of exceedance of a particular <del>wind velocity</del> <u>magnitude</u> <u>is negligible or when uncertainties in hazard frequency are so large that they prevent any valuable insight to be driven.</u></p>   | <p>Beginning of paras 6.23 is also applicable to any external hazards. As the frequency (resp. magnitude) of the external hazard decreases (resp. increases), uncertainties become more and more important, so that uncertainties may dominate the analysis. This has to be recognized setting additional screening criterion.</p> | X |   |  |
| Germany | 59. | 6.23 | ---  | <p>This requirement is much too specific for an individual hazard and belongs to an Appendix, should be deleted here</p>   |   | X | <p>The paragraph has been made more general (see comment #62 from ENISS)</p> |
| ENISS   | 63  | 6.24 | <p>For the screening process for <u>predictable</u> external <del>flood</del> hazards, <del>the following should be taken into consideration:</del> <u>criteria, such as those contained in annex ?, should be considered.</u></p> <p><del>(a) The location of the nuclear power plant with respect to distance to a river, sea or lake, and the possibility of any flood reaching the site.</del></p> <p><del>(b) The warning time</del>24:</p> | <p>Para. 6.24 is too detailed for a SSG. In addition, some parameters mentioned here may be applicable to other predictable hazards than external flooding. It is suggested to move the criteria to a new annex and should be generalized to apply to all predictable external hazards.</p>  |   | X | <p>The para is removed. See comment #60 from Germany</p>                     |

|         |     |      |   |   |   |  |  |  |
|---------|-----|------|---|---|---|--|--|--|
|         |     |      | <p>(i). This can be long enough to allow shut-off operations in plants located at river sites (e.g. more than one day in advance).</p> <p>(ii). For plants located at coastal sites, in general, the warning time is shorter and may sometimes be only a matter of hours or minutes in the case of a local tsunami.</p> <p>(iii). In addition to the warning time, the time dependent likelihoods of success in receiving the warning and of the success of potential preventive actions should also be considered.</p> <p>(e) The type of structure in place for retaining water.</p> <p>(d) It is possible that other, adjacent areas will be inundated as the flooding occurs and that the flood level will be higher than expected. A plant at the edge of a narrow flood plain is more likely to be flooded than a plant located in a wide delta area.</p> |   |   |  |  |  |
| Germany | 60. | 6.24 | ---   | This requirement is much too specific for an individual hazard and belongs to an Appendix, should be deleted here | X |  |  |  |
| Germany | 61. | 6.25 | For each internal hazard originating outside the plant buildings and for each external  | The understanding of hazards analysis seems to be missing, the sentence   | X |  |  |  |

|       |    |           |  |  |  |  |  |  |

| Netherlands | 12 | 10.16<br>–<br>10.17 | <p>10.16 Owing to slow accident progression in the case of loss of spent fuel pool cooling events, recovery actions and repair activity should be credited.</p> <p>10.17. The slow accident progression in the case of loss of spent fuel pool cooling events makes possible the participation of multiple actors in the process of diagnosis, decision-making and as well as in the execution of recovery actions and repair activity. This should be considered when defining performance shaping factors that mostly affect the success probability of recovery actions in these situations. Recovery actions and repair activities in general should not be taken into account. Exceptions should be justified in relation to the pace of accident progression and the ability of the organization to act sufficiently in time, as demonstrated by e.g. a plant simulator and training records.</p> | <p>The wording of 10.16 paragraph is not appropriate (it states that recovery actions should be credited, which in a SG is a recommendation). We propose to change the wordings and state that these actions can be credited only in case of slow pace of the accident.</p> <p>We suggest to delete 10.16 end to add a couple of sentences at the end of the current paragraph 10.17.</p> | X |  |  |  |
| ENISS       | 89 | 10.17               | <p>This should be considered when defining performance shaping factors that mostly affect the <del>success</del> <u>failure</u> probability of</p>  | <p>In PSA, estimated probabilities rather correspond to failure probabilities than to success probabilities</p>   | X |  |  |  |

|                   |    |                   |   |  |   |   |  |  |
|-------------------|----|-------------------|---|--|---|---|--|--|
|                   |    |                   | recovery actions in these situations.   | which are, for the vast majority, very close to one.   |   |   |  |  |
| ENISS             | 90 | 10.21             | The combined or separate interpretation of risk from accidents involving the spent fuel pool and the reactor core should be consistent with the <del>national</del> <u>probabilistic</u> safety goals <u>specified in national regulations or guidelines</u> .                | The term “ <i>national</i> ” is not clear. “ <i>probabilistic</i> ” is missing.<br>Consistency with para 2.21  | X |   |  |  |
| Republic of Korea | 1. | 10.22 / Lines 2-3 | 10.22 There is no international consensus on whether or not to aggregate the Level 1 PSA risk results of the spent fuel pool with those of the reactor. <del>However, the risk results for the reactor and the spent fuel pool should be aggregated in the Level 2 PSA.</del> | Since the Chapter 10 (Specifics of Level 1 PSA for spent fuel pools) mainly describes the specifics of the Level 1 spent fuel pool PSA and there is no consensus on aggregation of SFP risk as described in para. 10.22, we strongly suggest this sentence should be deleted. Instead, IAEA should develop the methodology on how to consider the SFP risk in PSA, if necessary. |   | X | It is acceptable that since there is no consensus on that it cannot be presented as a ‘should’ statement. Nevertheless given the fact that there is international experience on aggregating risks coming from reactor core and SFP in PSA Level 2 and 3, the statement is made as informative (not should statement) and is moved to the footnote. |  |
| US                | 11 | 10.22             | There is no international consensus on whether or not to aggregate the Level 1 PSA risk results of the spent fuel pool with those of the  | Risk can be aggregated after Level 3. Not Level 2 PSA. Modified text to address that point. Also   |   | X | Simplified version is addressed  |  |

|       |    |       |  |   |   |   |                          |  |
|-------|----|-------|--|---|---|---|--------------------------|--|
|       |    |       | reactor. However, the <u>risk</u> releases from results for the reactor and the spent fuel pool and reactor core should be <b>appropriately</b> aggregated in the Level 2 PSA. <b>The risk can be appropriately aggregated after a Level 3 PSA.</b>  | added the word “appropriately” to acknowledge that release from SPF and the reactor cannot be simply added.   |   |   |                          |  |
| ENISS | 92 | 10.23 | If both risk <u>metric</u> estimates are to be aggregated to generate an overall risk <u>metric</u> estimate that quantitatively describes the vulnerability of the plant to severe accidents, the correlations between the accident sequences of the spent fuel pool and the reactor should be considered, rather than simply summing these estimates (i.e. similar to aggregating multi-unit or site core damage frequencies, see Section 11). | For clarity. The outputs of the level 1 PSA are a risk metric rather than a risk to the public or environment. Risk metric is used in section 11 which is referenced. | X |   |                          |  |
| UK    | 4  | 11.2  | MUPSA models <b>will usually be</b> developed based on single unit PSA models, and take into account the specifics of each unit under consideration.   | Whilst the IAEA MUPSA methodology (Safety Report to be issued) relies upon a single unit approach, this should not be mandatory.                                      |   | X | Use the word “typically” |  |
| ENISS | 91 | 11.3  | As described in para. 2.2, the scope and the need for MUPSA should be correlated with the <del>national</del> probabilistic safety goals or criteria, if <u>they</u> <del>latter</del> have been set <u>specified in national regulations or guidelines.</u>   | The term “ <i>national</i> ” is not clear. Consistency with para 2.21   | X |   |                          |  |

|         |     |              |   |  |  |   |   |   |
|---------|-----|--------------|---|--|--|---|---|---|
| UK      | 5   | 11.4 & 11.5  | <del>If the national policy requires, then</del><br>Additional risk metrics other than the ones used in single unit PSA (e.g. core damage frequency) <del>should</del> <b>can</b> be developed in order to express the risk profile in the context of multiple unit nuclear power plants for corresponding decision-making.   | A MUPSA may not be required by national safety goals but may be developed by designers or operators risk inform design, operation and decision making. |  |   | X   | The statement is related to the risk metrics not the safety goals. Risk metrics is defined in TECDOC-1804 as<br><i>Risk metrics: A measure that is used to express the risk quantity of interest.</i> |
| Germany | 84. | 11.5 line 14 | <u>As announced in para 1.12 this Safety Guide focusses on the reactor core and the fuel in the spent fuel pool. However, depending of the scope of the PSA, for risk aggregation, multi-unit aspects as well as potential effects from other radioactive sources on the nuclear power reactor(s) and/or the spent fuel pool(s) collocated on the site (e.g. interim fuel storage facilities, nuclear waste treatment facilities) should be considered within the PSA.</u><br>Risk metrics for multi-unit PSA should be defined so as to capture... | Missing aspect of MUPSA was added  |  | X | The issue is not related to the risk metrics and more relevant to the MUPSA scope. It has been added to the 11.4 as a footnote. |   |
| Germany | 85. | 11.23        | <u>In order to address all effects and interdependencies of multiple collocated units and/or sources it is recommended to use a combined common site risk model including all considered initiating events, accident sequences and mitigating</u>   | Missing aspect of MUPSA risk aggregation   |  | X | Added with slight modification (the word recommended is related to the “should” statement, so it was                            |   |

|         |     |       |   |  |   |  |  |  |

|  |  |  |  |  | <p>and the Annex III was not considered to be in the list of the major items required significant revision. Therefore, full revision of Annex III is not considered to be needed.</p> <p>We are planning consultancy meetings after receiving the feedback from the Member States. It would be great if experts from Germany could join this working group to provide input on FAK-16 guidance and potential updates of German experience reflected in Annex III.</p> |  |
